

ALAYNA JOHNSTON

Full-Stack Software Engineer | Building user-facing products end to end

Chicago, IL • alaynajohnston12@gmail.com • linkedin.com/in/alaynajohnston98 • alaynajohnston.netlify.app • github.com/ayyjayy2

SUMMARY

Full-stack engineer with 5+ years shipping user-facing web applications, from an enterprise platform processing 100M+ records daily to a multi-user product architected and built independently. Owns work end to end: UX design spike, Angular front end, Java microservices, and production release. 221 stories and 418 story points delivered across 19 quarters, 546 peer pull requests reviewed, a production outage traced to root cause, and the tooling and documentation that makes the rest of the team faster.

SKILLS

Languages: Java, TypeScript, JavaScript, SQL, HTML/CSS, PowerShell

Frontend: Angular, RxJS, React, React Native, PWA and service workers, design systems, responsive UI

Backend: Spring Boot, REST APIs, microservices, Firebase/Firestore, authentication and security rules, data pipelines

Data & Delivery: Oracle SQL, GCP BigQuery, Jenkins CI/CD, release management, automated and regression testing

Tools & AI: Git, GitHub, Jira, Swagger, Insomnia, Firebase emulator, Claude Code, GitHub Copilot

EXPERIENCE

Associate Software Engineer | Surescripts, LLC | Remote | Mar 2022 - Present

- **Owned end-to-end delivery of a new configuration management interface** for a national healthcare data platform: authored the UX design spike, then shipped 12 of the 15 stories in the resulting epic across an Angular front end and its supporting Java microservice.
- **Delivered the largest share of a year-long patient privacy initiative**, implementing 20 of the 36 stories in its primary epic across an Angular web UI, Java REST services, and an Oracle record-linkage database, and authoring the design and test-case documentation the team built against.
- **Led root cause analysis of a production outage** in a patient record search service, tracing it to an unsafe configuration default that let production connect to a development database; audited 40+ service configurations, surfaced a second unreported instance, and shipped both fixes.
- **Authored rb-create, a release-branch automation skill** published to the team's internal GitHub marketplace, converting a process run by hand across 23 release branches into a repeatable workflow that proves regressions are clean before a branch is cut.
- **Cut 23 release branches across 8 quarters**, coordinating SYSTEST deployments, regression pipelines, and service releases through to production; 9 of those in the first three quarters of 2026, matching all of 2025.
- **Grew quarterly output from 19.8 to 40 story points year over year** and cut average story completion time from 7 days to 4, with 65% of stories scoped at 2 to 3 points.
- **Reviewed 546 peer pull requests, 306 in 2026 alone**, and delivered across 65 repositories spanning an Angular web frontend, Java backend microservices, and data processing pipelines.
- **Ran 32 technical spikes** to scope unknowns and de-risk work before team commitment; authored 11 Jira stories, 9 of them scoped for other engineers to pick up; remediated high-severity vulnerabilities from automated scanning.
- **Wrote 33 internal engineering guides** on application setup, security scanning, deployment troubleshooting, and dashboard configuration, published as standing team reference; demoed 24 features across 19 quarters.

Software Engineer | Tata Consultancy Services | Remote | Jan 2021 - Mar 2022

- Built and shipped full-stack web applications in Agile teams using Angular, Java, Spring Boot, and REST APIs, following the firm's full-stack engineering program.

PROJECTS

The Itinerists | Multi-user travel planning PWA | Angular 19, TypeScript, Firebase/Firestore, RxJS, Leaflet

- **Designed and built a multi-user, multi-trip travel planning Progressive Web App** in Angular 19 and TypeScript, spanning 20+ lazy-loaded feature pages (itinerary, flights, stays, transport, maps, packing, expenses) across 150+ merged pull requests.
- **Re-architected a single-trip prototype into a reusable multi-trip platform**, writing data migrations that carried live user data forward without breakage.
- **Architected a real-time Firestore backend** with authentication, security rules, and an invite/join trip-sharing flow, verified by an automated Firebase emulator test suite.
- **Built group expense splitting** with equal and per-person splits, multi-currency conversion, and net-balance settlement math, plus Leaflet maps with destination-aware geocoding and namespaced Firestore geocode caching.
- **Shipped as an installable PWA** with service-worker caching, a mobile-first responsive design system, and gesture-based navigation.

EDUCATION

B.S. Information Systems | Coastal Carolina University | 2020

Study Abroad | Mahidol University International College, Thailand | 2019
